

# Breast Radiotherapy, the British experience. A case for hypofractionation.

Murray Brunt

University Hospital of North Staffordshire

Vienna, 15 October 2010

# The Cancer Centre

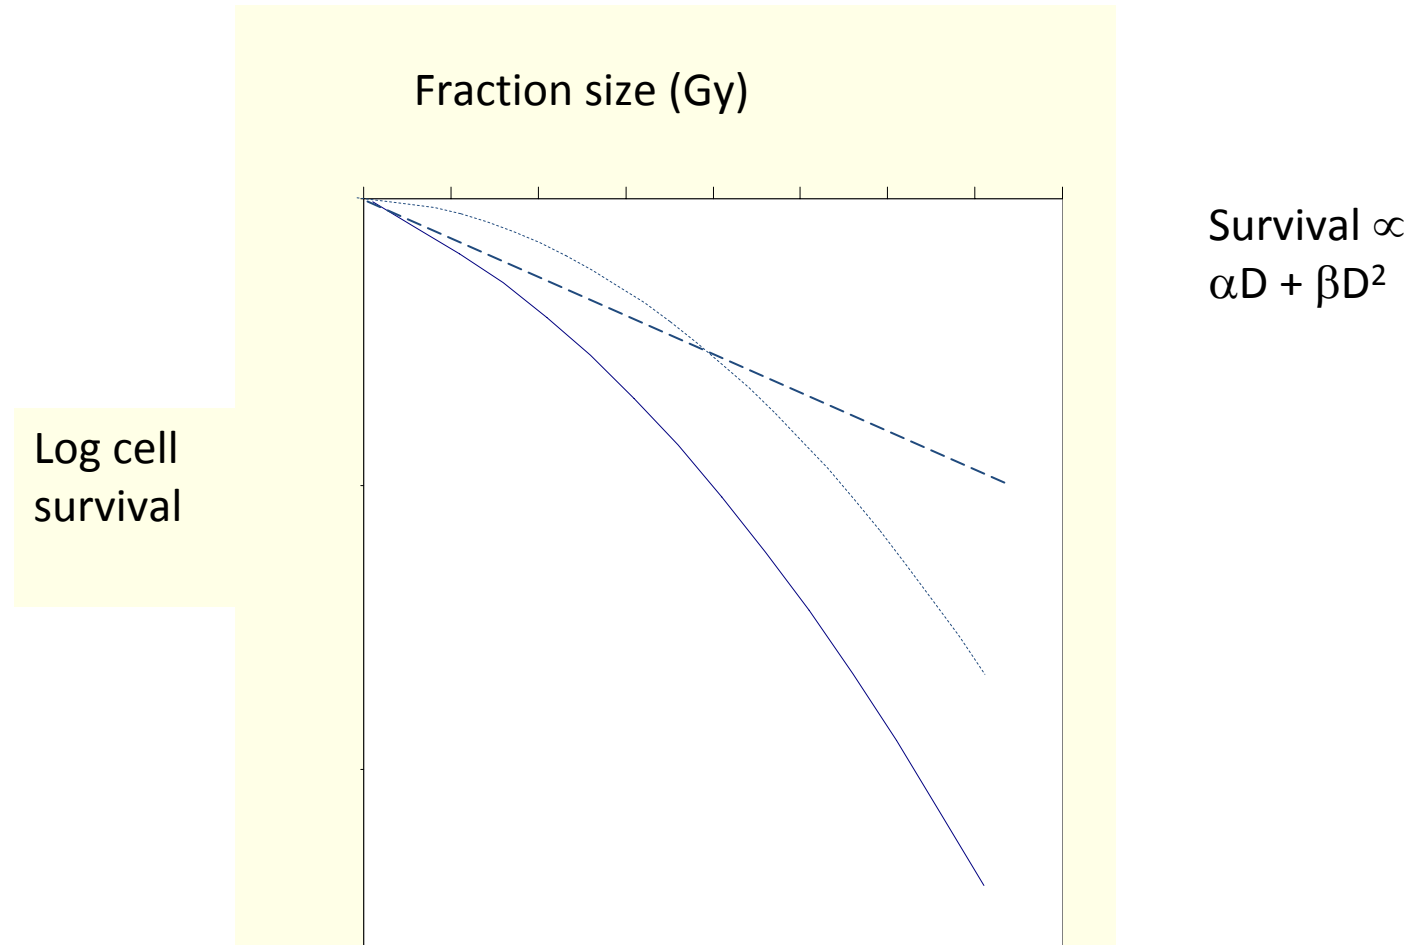

# Randomised Trials (N >7000)

Trial	Test arms	
	Fraction size (Gy)	Total dose(Gy)
Ontario	2.7	42.5
RMH/GOC	3.3	42.9
START A	3.0/3.2	39.0/41.6
START B	2.7	40.0

# Other UK Trials

- FAST
- IMPORT HIGH
- FAST FORWARD

# Cell survival is well described using linear and quadratic components

# Early Reacting Normal Tissues (NT): Insensitive to Fraction Size

Early reacting NT  
Double the fraction size  
Double the effect

Many cancers respond  
like this, too

# Late Reacting Normal Tissues (NT): Sensitive to Fraction Size

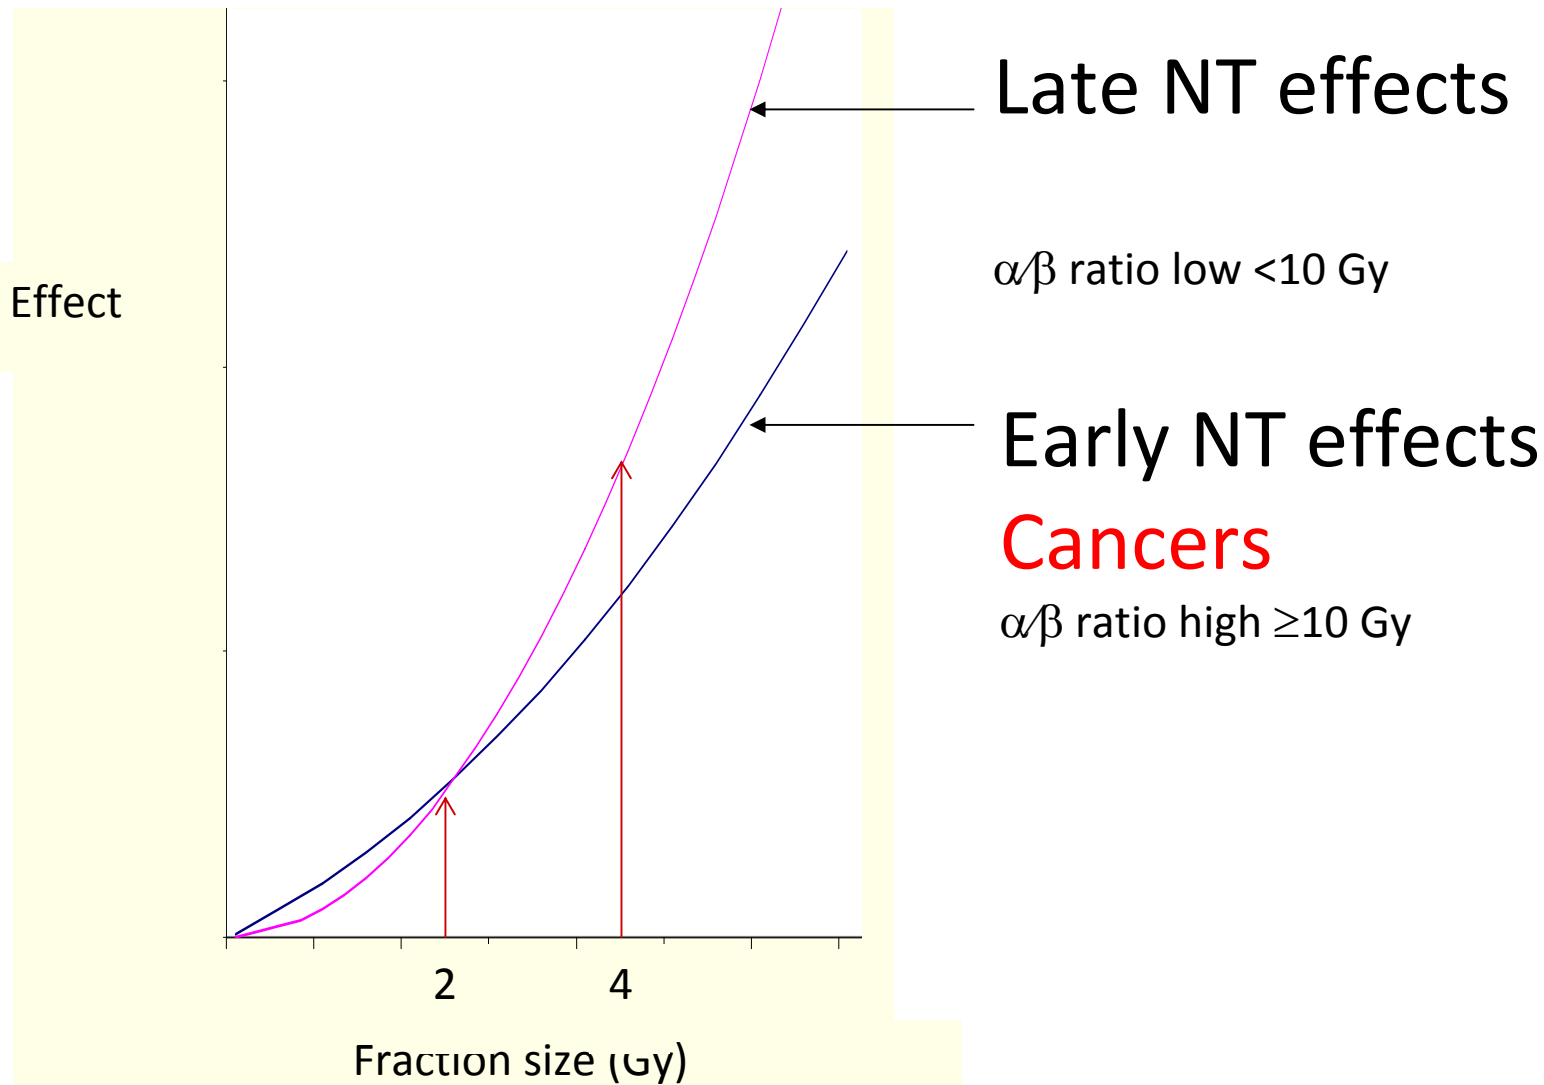

Effect

Late reacting NT  
More upward curvature

Curvature described  
by polynomial:  
Effect =  $\alpha D + \beta D^2$

# Standard Model....

# Standard Model

Effect

“Fractions < 2 Gy spare late NTR relative to tumour”

# Standard Model Faces a Challenge....

Late NT effects

**Breast cancer?**

$\alpha/\beta$  ratio low  $<10$  Gy

Early NT effects

**Head & Neck cancer**

$\alpha/\beta$  ratio high  $\geq 10$  Gy

# Hypothesis

"Breast cancer is  
**as sensitive** to fraction size  
as the late-reacting  
normal tissues"

If true, small fractions spare  
breast cancer as much as  
the late-reacting NT

# RMH/GOC Trial Design

Total Dose (Gy)	Fraction size (Gy)	Fraction number	Time (week)
*39.0	3.0	13	5
50.0	2.0	25	5
°42.9	3.3	13	5

\* equivalent to 50Gy/25F if  $\alpha/\beta$  value = 2 Gy

° equivalent to 50Gy/25F if  $\alpha/\beta$  value = 6 Gy

# RMH/GOC Trial Endpoints

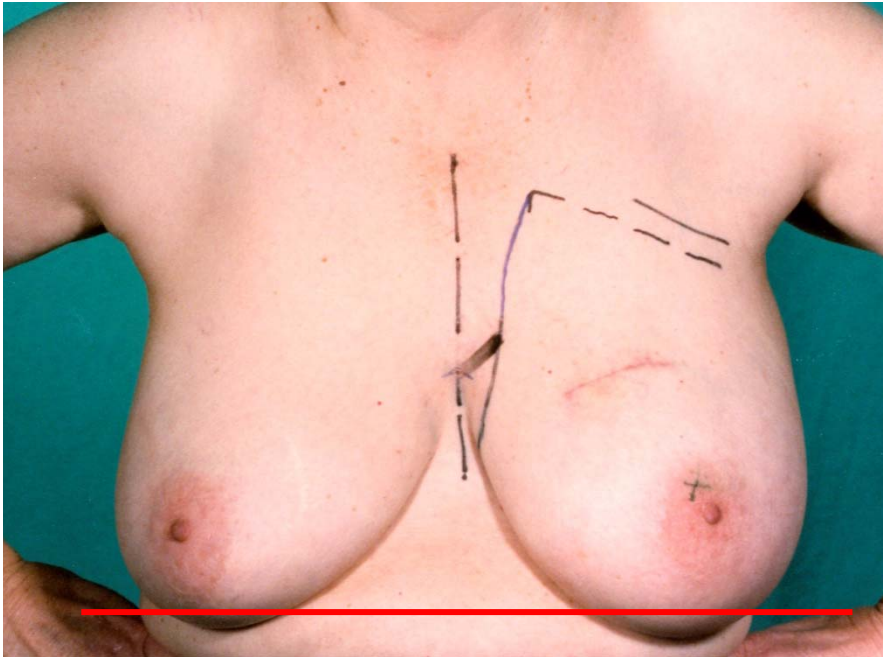

- Primary:
  - Change in breast appearance
- Secondary:
  - Breast shrinkage, oedema, telangiectasia, induration
  - Tumour control

# Late Normal Tissue Responses e.g. Breast Shrinkage (Fat Atrophy)

---

Before RT

Several years later...

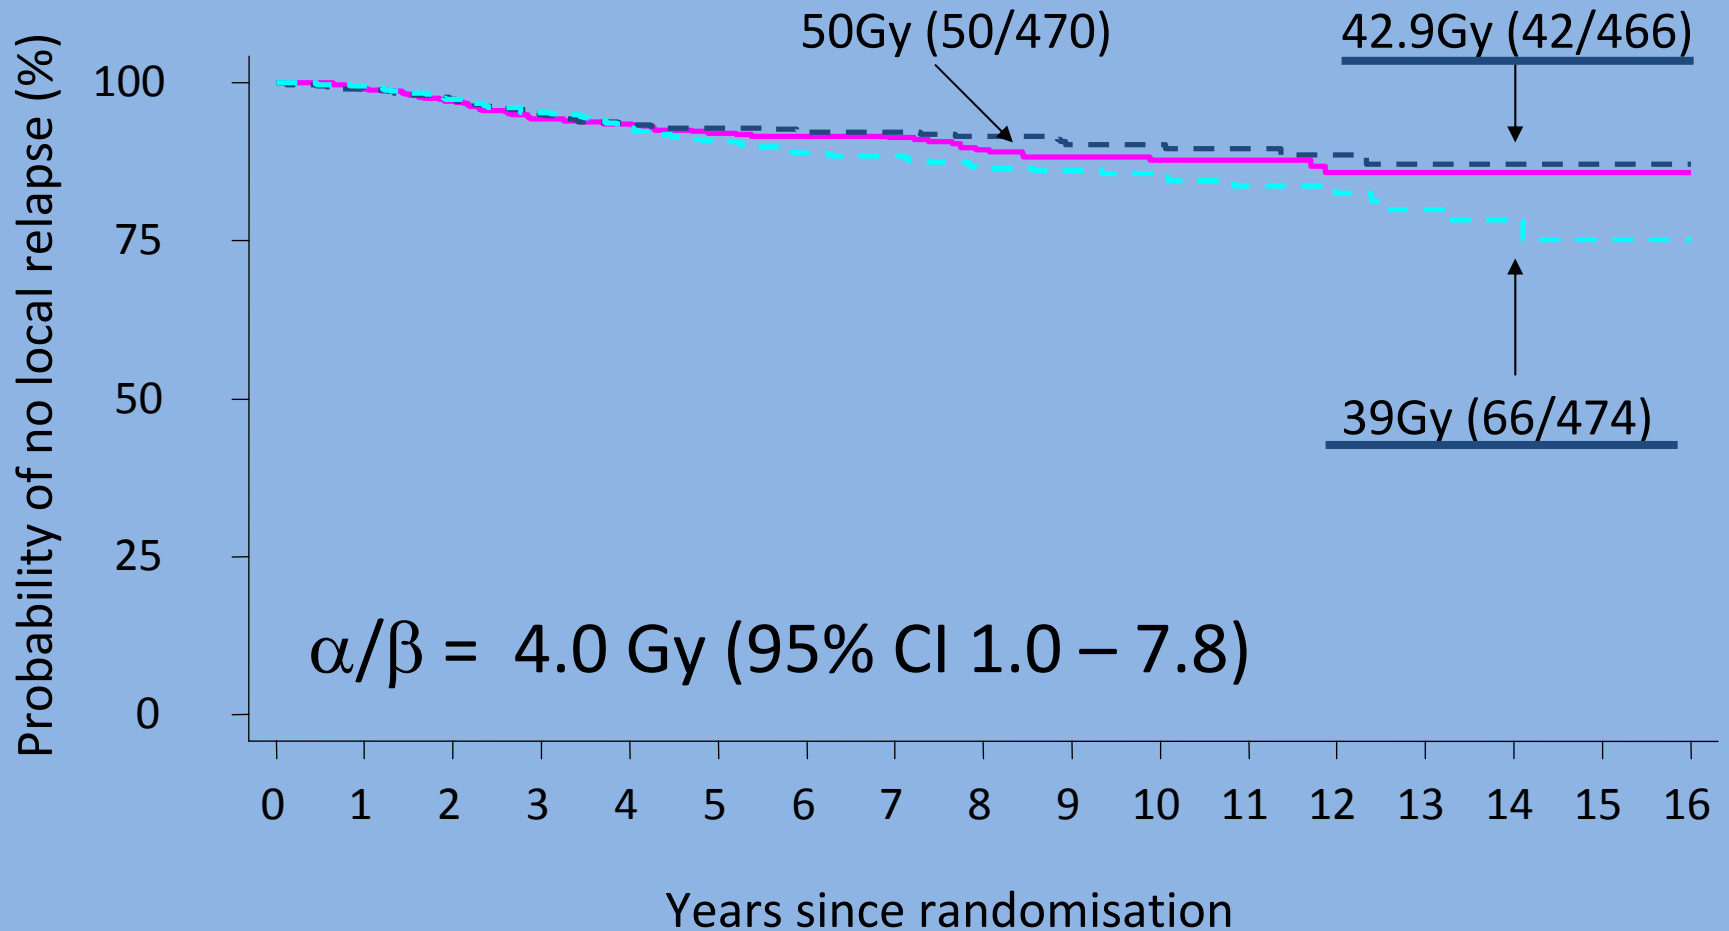

# Marked Change in Breast Appearance (n=1410)

# Marked Change in Breast Appearance

# Local tumour relapse

# Fractionation Sensitivity of Late Side Effects and Tumour Control

Effect	$\alpha/\beta$ value (95% C.I.)
Any change in breast appearance	3.6 Gy (1.8 – 5.4)
Palpable breast induration	3.1 Gy (1.8 – 4.4)
Tumour control	4.1 Gy (1.0 – 9.7)

# Background

---

START pilot study (N=1410) suggests that

- 13 fractions of 3.2Gy (41.6 Gy) cause the same level of late adverse effects as 25 fractions of 2.0Gy (50 Gy) [1]
- Tumour response (local control) is as sensitive to fraction size as the late adverse effects [2]

If confirmed, radiation fractions  $> 2.0\text{Gy}$  have advantages in breast cancer

1. Yarnold J et al. Radiother. Oncol 2005; 75: 9-17

2. Owen R et al. Lancet Oncol 2006; 7: 467-71

# START Trials: Aim

---

To test the benefits of fraction sizes  $>2.0\text{Gy}$  in terms of:

- local-regional tumour control
- late normal tissue responses
- quality of life & cost-effectiveness

in patients with early breast cancer

Sensitivity to fraction size indicated by  $\alpha/\beta$  ratio:

$< 10$  = sensitive

$\geq 10$  = insensitive

# START Trials: design and endpoints

Women with completely excised  
invasive breast cancer, T1-3 N0-1 M0

**Primary endpoint:**  
local-regional relapse

**Secondary endpoints:**

normal tissue effects (NTEs)

- annual physician assessments of induration, shrinkage, oedema
- photographs (baseline, 2y & 5y)

quality of life EORTC Breast, body image, HADS (baseline, 6m, 1y, 2y, 5y)

**Additional endpoints:**

- disease-free survival
- overall survival

Number of patients

# FAST Trial: Aim

To test a 5-fraction regimen of whole breast RT against 25 fractions of 2Gy after local excision of early breast cancer in terms of:

- late normal tissue responses
- local tumour control

# FAST Trial: Design

## Primary Endpoint:

- Photographic change in breast appearance at 2 years
- NONE, MILD, MARKED change compared with pre-RT baseline (Clin Oncol 2008;20:497-501)

## Secondary Endpoints:

- Change in photographic breast appearance at 5 years
- Annual clinical assessments of breast induration, shrinkage, oedema
- Local tumour relapse

# FAST Trial: Sample size

## Assume:

- 20% change in breast appearance at 2 years
- Detect 10% difference between test groups (90% power, 5% significance)
- Allow for 10% loss to follow-up / unevaluable

300 patients required per group = 900

# Patients and follow-up

- 915 patients at 18 UK centres 2004-'07
  - Mean age 63 years (range 50-88)
  - 71% ductal histology
  - 81% <2cm tumour size
  - 88% grade 1 or 2
  - 11% no adjuvant therapy
  - 89% endocrine therapy
- 98.9% patients received allocated treatment
- All patients had 3D dose compensation\*
- Median follow up 2.3 years

\* All centres had to undergo a rigorous QA programme before trial initiation

# Acute Skin Reactions

RTOG grade	50Gy (%) N=110	30Gy (%) N=111	28.5Gy (%) N=106
0 or 1	53.7	85.6	89.7
2=tender/bright erythema +/- dry desquamation	35.5	11.7	8.5
3=patchy moist desquamation	10.9	2.7	1.9

No patients had grade 4 toxicity reported (confluent moist desquamation)

# Change in Photographic Breast Appearance

Change at 2 years	50Gy (%) N=229	30Gy (%) N=232	28.5Gy (%) N=225
None	79.5	66.8	76.0
Mild	18.8	24.1	20.0
Marked	1.7	9.1	4.0
		20.5	33.2
			24.0
P-values vs. 50Gy		<0.001	0.22

77% of 2-year assessments currently available

# Moderate/marked Radiotherapy Adverse Effects in Breast\*

\*Includes shrinkage, induration, telangiectasia, oedema & other.

Year 1 events excluded - mostly reflect surgical and acute transient RT effects.

# Fractionation Sensitivity ( $\alpha/\beta$ estimates)

- Change in breast appearance (photographs):

$$\alpha/\beta = 2.4\text{Gy (95\% CI 1.0–3.9)}$$

- Breast shrinkage (clinical):

$$\alpha/\beta = 2.7\text{Gy (95\% CI 1.6–3.7)}$$

If  $\alpha/\beta = 2.5\text{Gy}$

28.5Gy in 5F  $\equiv$  51.9Gy in 2.0Gy fractions

# Relapse and Survival

At median follow up of 2.3 years - disease outcome is currently immature:

- 2 patients with local relapse
- 2 patients with regional relapse
- 10 patients with metastatic disease
- 15 patient deaths (8 from breast cancer)

# FAST Conclusions

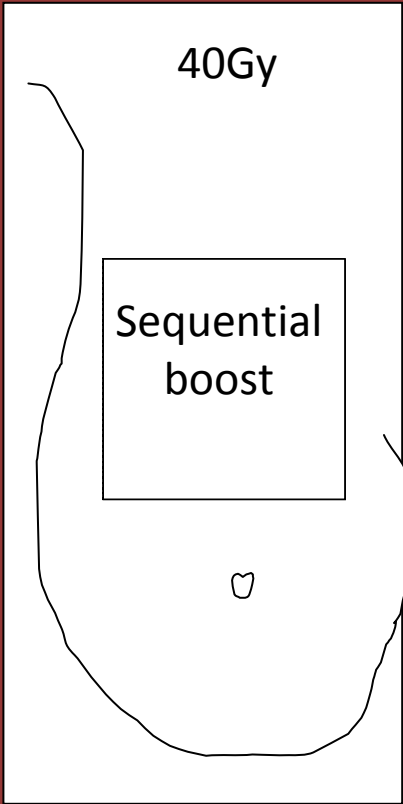

- Using  $\alpha/\beta$  estimate, one can identify a 5F schedule of whole breast RT  $\equiv$  50Gy/25F in terms of adverse effects of late reacting normal tissues
- Local relapse rate currently very low
- Follow-up continuing

# IMPORT HIGH: Aim

- To test dose escalated IMRT after conservation surgery for women with higher than average local recurrence risk early breast cancer

# IMPORT HIGH Trial (showing physical doses)

Control

15F

# Intensity Modulated Partial Organ RT: NCRI IMPORT HIGH Trial

# **IMPORT HIGH: Endpoints**

- **Primary**
  - **Palpable induration**
  
- **Secondary**
  - **Other late adverse effects & QL**
  - **Local tumour control**
  - **Location of tumour relapse**
  - **Contralateral primary tumours**
  - **Regional and distant metastases**

# Hypofractionation: the Future

- Likely that breast cancer is as sensitive to fraction size as the critical late-reacting normal tissues
- Likely that patients can be safely and effectively treated to a lower total dose with fewer fractions

**What are the limits of this approach?**

# FAST Forward Trial (N=4000)

---

	TD (Gy)	N	# (Gy)	T
Control 1	40.0	15	2.67	3 weeks
Test 1	27.0	5	5.4	5 days
Test 2	26.0	5	5.2	5 days

Primary endpoint: local tumour control

## New Review

James ML, Lehman M, Hider PN, Jeffery M, Francis DP, Hickey BE. Fraction size in radiation treatment for

“We have evidence from two high quality trials that the use of unconventional fractionation regimes (> 2.0 Gy per fraction) does not affect breast appearance or toxicity & does not seem to affect local recurrence.....”

# Other Benefits

Acceleration

Convenience

Partial breast RT

40 Gy/15F gentler on  
brachial plexus than  
50 Gy/25F!

Synchronous boost

# Conclusions

Women should be offered the benefits of hypofractionation

- 40 Gy in 15 fractions is
  - Safe
  - Effective
  - Convenient
  - Economical

# Meta-analysis of START Pilot Trial & START Trial A

- Tumour relapse (294 events/3646 pts):
  - Adjusted  $\alpha/\beta = 4.6 \text{ Gy}$  (95%CI 1.1-8.1)
- Adverse effects (754 events/2257 pts):
  - Adjusted  $\alpha/\beta = 3.4 \text{ Gy}$  (95%CI 2.3-4.5)
- Data suggest that small fractions spare the cancer as much as healthy tissues!

# Ontario Trial : Implications for Fractionation Sensitivity

- If schedules are truly iso-effective for both tumour & NT effects,  
 $\alpha/\beta$  value = 3 Gy  
(if no time effect)

# Radiotherapy – increasing fraction size

60 Gy over 8 weeks + 30 Gy boost (Montague 1968)

<b>Complications</b>	<b>5 fractions per week</b>	<b>3 fractions per week</b>
Chest wall necrosis, fibrosis, rib fracture.	3%	13%

# Linear-Quadratic model
